

Laser-controlled lightning

The Teramobile laser permitted us to trigger and guide high-voltage (1 MV) discharges along filamentation in air. Those results open the way to active laser-control of lightning.

*Laser-guided discharge: straight path
and discharge voltage reduced by 30 %*

An international collaboration

Teramobile is an international project initiated jointly by a French-German collaboration of CNRS and DFG. It is now funded by ANR and implies 5 laboratories:

- LASIM (CNRS/University Lyon 1, J. P. Wolf)
- Free University of Berlin (L. Wöste)
- University of Jena (R. Sauerbrey)
- LOA (CNRS/X/ENSTA, A. Mysyrowicz)
- GAP (Université de Genève (J. P. Wolf)

A unique tool

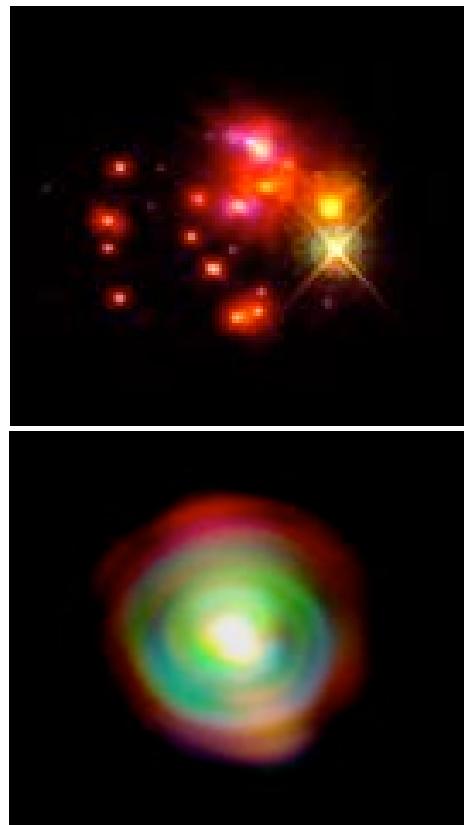

The Teramobile system is the first mobile laser yielding **5 terawatts (TW)** and **100 fs** (10^{-13} s) pulses. It concentrates the state-of-the-art laser technology in a 20' standard freight container, allowing field measurement campaigns (below at Tautenburg observatory, Germany).

fs-TW pulse propagation

The Teramobile laser allows outdoor measurements, hence over very long distances. The non-linear propagation of powerful laser pulses raises fundamental physical questions as well as new application opportunities:

- propagation as **self-guided filaments** by Kerr effect, where the ionised air is electrically conducting (lightning control)
- broadband « white light » continuum generation (230 nm-4 μ m). This « **white-light laser** » covers the absorption band of many atmospheric pollutants (multi-component optical remote sensing)

Multi-component Lidar pollution remote sensing

Our fs-TW laser used as a « white-light laser » allows simultaneous remote sensing of multiple pollutants. We have characterized a urban ozone pollution episode, measuring the several species involved.

Backscattering of a laser beam up to 10 km: cloud measurement based on multiple scattering
